2 Introduction

XoomPoint Methodology is based on over a decade of software engineering and consultancy expertise, best industry practices and the well-acknowledged ISO standards and guidelines listed in *Appendix I*. XoomPoint Methodology is verified against other accepted industry standards, such as PMI's PMBOK, Six Sigma, PRINCE2, SEI CMMI and MSF.

2.1 Introduction to Support Services Guide

The Support Services Guide describes the standardized processes in Support Services Organization. Together with the accompanied how-to documents it covers the work phases, responsibilities, maintenance, and change management.

Although Support Services Guide is primarily intended for support personnel, product and project managers and development team members, it is also suitable study material for all the company's representatives participating in the project work, including the account managers, members of R&D and project steering boards.

The Support Services Guide describes the processes, guidelines and general methodology for personnel working in the Support Services. It also lists all the mandatory pre-requisites needed for successful hand-over of project deliverables to support organization.

There are templates and checklists available for deliveries-to-support process and support work, and they are referred to in the Support Services Guide. These templates and checklists give detailed information on how to ensure smooth service.

2.2 Outlining

With our years of project experience we know that every project is different. Just as the software solutions provide a number of ways for an enterprise to leverage their flexibility, those same opportunities can provide a challenge when it comes time to upgrade a customized solution to the next release. A variety of other factors can contribute to challenges in upgrading the solutions. In any environment, changes in maintenance approaches over time result in environments that need significant preparation before an upgrade can be undertaken. Also for these reasons, in order to ensure smooth upgrades and revenue streams we need well-defined procedures on how to hand over the deliverables to support organization. For instance, an initial high-level system review and well-defined processes are critical to a successful upgrade.

Regardless of the readiness of the environment and the business community to undertake an upgrade project, proper planning, systematic preparation, and participation is a key to success. Commitment to scope is also paramount. Attempting the introduction of new features and new modules can negatively impact reaching the paramount goal of upgrading the customized solutions.

As described in the QA and Software Testing Guide thorough project deliverable testing during all the project phases can also be a valuable asset in minimizing potentially adverse impact during the future upgrades. The amount of post-delivery support can usually be directly correlated based on the amount of testing and number of resources dedicated to the QA phases in the project. The less time spent testing, the more post-delivery support, the higher is the likelihood of post-delivery and upgrade issues.

The client-centric processes defined in the Support Services Guide assist in building lasting relationships and strong revenue streams. Effective support services for customized solutions can make the difference between success and failure in customer relations. Satisfied customers tell three others of their experience, unhappy customers tell eleven others. In order to efficiently support customized solutions XoomPoint Methodology sets the following objectives:

- Determine feasibility and approach to centralize support services for customized solutions
- Identify cost effective options and alternatives
- Determining realistic service objectives and associated metrics
- Define a high level strategy to achieve the desired service model

- Develop and prioritize specific initiatives to support this strategy
- Determining appropriate staffing and scheduling

Standardizing project management practices and extending them to cover support services aims at carrying out projects as production-like repeatable processes where agreed standard methods are followed systematically in development, project work, quality planning, defect management and correction, as well as in improving maintenance, customer support and future upgrades of the deliverables.

2.3 Benefits of Using the Methodology

The methodology described in the Support Services Guide is applicable to initiatives of all sizes, using a 'light' version for small projects. The methodology presented in is used in feasibility study, change survey, specification and design projects, as well as in implementation and deployment projects. The methodology is not limited to software development and delivery projects, but may also be utilized in an applied form in product development or subcontracting projects, for example.

Each project will go through the same phases, some projects more systematically than others, and produce the same supportive material to allow professional and accurate technical support.

The use of the methods promotes systematization and repeatability and saves time in the long run. Some time will be spent on and must be reserved for the study of the methodology in the first project. With each of the subsequent projects, the use of the methodology will become easier and more professional.

Support personnel, product and project managers and Quality Assurance personnel should use this guide as a checklist from time to time, even after they have become familiar with the methodology.

3 Contents of the Support Services Guide

Support Services Guide covers the top-down model for working in the Support Services. It also covers the major areas relating to successful hand-over of deliverables in order to avoid typical shortcomings.

Support Services Guide lists the supportive material and describes the contents of deliverables considered as pre-requisites for hand-over. These are defined in close co-operation with solution key experts and they include the functional, technical and user documentation, list of contacts persons (Second Line and Third Line Support), software packages, system descriptions, deployment information, installation instructions, maintenance plans, etc.

In large customized solutions the project organization produces a dedicated Transition Plan, which describes the phases and deliverables for each phase. It also contains a plan for knowledge transfer with scheduled training, whenever necessary.
